

Environmental policy for Doro group

Doro develops environmentally friendly products that meet customer requirements for product safety and quality. It is important to us to develop and supply products with

- low energy use
- conformity to applicable legislation
- relevant information about our products' environmental properties available
- possibility to recycle materials, where we also aim for materials with low environmental impact
- for Care products: very long lifetime, including possibility to change worn parts and clean the products, making it possible to hand the product over from user to user

Our alarm receiving centres are an important part of the municipalities' work for lowering their environmental impact. With our services, unnecessary visits to users can be avoided, especially when using remote monitoring.

Our employees, customers and suppliers are important stakeholders for environmental issues. Our environmental management system makes sure the environment is continuously on the agenda.

- We will work towards continuous improvement, pollution prevention and reduction of carbon footprints, using a Life Cycle perspective
- We will comply with applicable laws and other requirements applicable to the organisation
- We will encourage our suppliers to actively work with the environment and take responsibility for their products' / services' impact on the environment.
